

LEXTRA LEARNING

ADVANCED LEVEL MATHEMATICS

A2: Differentiation and Integration – Year 13

Name:

TIME ALLOWED: 1 HOUR

INSTRUCTIONS TO CANDIDATES

1. This examination paper contains **6** questions and all are compulsory.
2. Answer all questions. The marks for each question are indicated at the beginning of each question.
3. Answer each question beginning on a **FRESH** page of the answer book.
4. This **IS NOT an OPEN BOOK** exam.
5. Candidates may use calculators. However, they should write down systematically the steps in the workings.

LEXTRA LEARNING

A2: Differentiation and Integration

Question 1. The curve C has equation $x^2 \tan(y) = 9$ for $0 < y < \frac{\pi}{2}$

(i) (4 marks) Show that

$$\frac{dy}{dx} = \frac{-18x}{x^4 + 81}$$

(ii) (3 marks) Show that the point of inflection of C lies at $x = \sqrt[4]{27}$

A2: Differentiation and Integration

A2: Differentiation and Integration

Question 2. (*7 marks*) Evaluate the following integral

HINT: USE SUBSTITUTION $\alpha = \ln(x)$, THEN INTEGRATE BY PARTS

$$\int \sin(\ln(x)) dx$$

A2: Differentiation and Integration

A2: Differentiation and Integration

Figure 1: The curve C , with shaded region R

Question 3. For $0 \leq t \leq \frac{\pi}{2}$, the curve C has following parametric equations

$$\begin{aligned} x(t) &= 8 \sin^2(t) \\ y(t) &= 2 \sin(2t) + 3 \sin(t) \end{aligned}$$

- (i) (7 marks) Show that for region R bounded below the curve to x -axis from $x = 0$ to $x = 4$, as shown in FIGURE 1 has area given by

$$\int_0^a (8 - 8 \cos(4t) + 48 \sin^2(t) \cos(t)) dt$$

- (ii) (4 marks) Hence, use algebraic integration to evaluate the area in region R as shown in FIGURE 1

A2: Differentiation and Integration

A2: Differentiation and Integration

A2: Differentiation and Integration

Question 4. There exists a smooth and continuous function $y = f(x)$ which obeys the following differential equation for $0 < y < 1$

$$2\frac{dy}{dx} = y - y^2$$

- (i) (5 marks) Using partial fractions or otherwise, find the general solution to the differential equation in the form $y = f(x)$
- (ii) (3 marks) Evaluate the following limits

$$\lim_{x \rightarrow +\infty} f(x)$$
$$\lim_{x \rightarrow -\infty} f(x)$$

A2: Differentiation and Integration

A2: Differentiation and Integration

Question 5. (*7 marks*) Boyle's Law states that when a gas is kept at a constant temperature, its pressure P , which is measured in Newton per meter Nm^{-2} , is inversely proportional to its volume V , which is measured in cubic meters m^3 .

When the volume of a certain gas is $80m^3$, its pressure is $5Nm^{-2}$ and the rate at which the volume is increasing is $10m^3s^{-1}$.

Find the rate at which the pressure is decreasing at this volume.

A2: Differentiation and Integration

A2: Differentiation and Integration

Question 6. A curve has equation $y = \frac{xe^{2x}}{x+k}$, where k is a constant and $k \neq 0$.

(i) (5 marks) Show that

$$\frac{dy}{dx} = \frac{e^{2x}(2x^2 + 2kx + k)}{(x+k)^2}$$

(ii) (5 marks) Given that y only has one stationary point, find the value of k and determine the nature of this stationary point.
